Step-by-Step Approach to Solving Equations Using the Distributive Property

To maximize the effectiveness of a worksheet, students should follow a systematic approach:

Step 1: Identify the Distributive Property in the Equation

Look for expressions where a coefficient multiplies a sum or difference inside parentheses, such as: $3(x + 4) = 0$

Step 2: Apply the Distributive Property

Distribute the coefficient to each term inside the parentheses: $3 \times x + 3 \times 4 = 0$ which simplifies to: $3x + 12 = 0$

Step 3: Simplify and Isolate the Variable

Subtract or add constants to both sides to isolate the term containing the variable: $3x = -12$

Step 4: Solve for the Variable

Divide both sides by the coefficient: $x = \frac{-12}{3}$ $x = -4$

Step 5: Check Your Solution

Substitute the value back into the original equation to verify correctness.
