DC Machines

- Work through the interaction of magnetic fields generated by field windings and the armature current. - Commutator ensures unidirectional torque and emf.

Synchronous Machines

- Rotor and stator magnetic fields synchronize in speed. - The rotor can be excited to produce a rotating magnetic field that interacts with the stator.

Induction Machines

- The stator produces a rotating magnetic field. - Induces current in the rotor, which in turn produces its own magnetic field, resulting in torque due to the relative motion (slip).
