Mathematically: $\Delta U = Q - W$ where: - ΔU = change in internal energy, - Q = heat added to the system, - W = work done by the system.

Second Law of Thermodynamics

This law introduces the concept of entropy and states: > In any natural process, the total entropy of a system and its surroundings tends to increase, leading to irreversibility. Implication: - Heat flows spontaneously from hot to cold. - No process is 100% efficient.

Third Law of Thermodynamics

It states: > As the temperature approaches absolute zero, the entropy of a perfect crystal approaches zero. This principle helps in understanding low-temperature behaviors and residual entropy.

Introduction to Chemical Engineering Thermodynamics

Thermodynamics, in the context of chemical engineering, is the science that deals with the relationships between heat, work, temperature, and energy in chemical systems. Gavhane's approach emphasizes understanding these relationships through fundamental laws, equations, and principles, enabling engineers to analyze processes such as distillation, refrigeration, combustion, and phase equilibria. Key Objectives of the Subject:

- To predict the equilibrium states of chemical systems
- To determine the direction of processes
- To calculate energy requirements for processes
- To optimize process parameters for efficiency

Gavhane's teachings stress the importance of a systematic approach—starting from basic principles and progressing toward complex applications—making the subject accessible yet profound.

Fundamental Principles of Thermodynamics

Understanding thermodynamics begins with its four fundamental laws, which form the backbone of the discipline.

1. Zeroth Law of Thermodynamics

This law establishes the concept of temperature and thermal equilibrium. It states that if two systems are each in thermal equilibrium with a third system, they are in thermal equilibrium with each other. This principle underpins the measurement of temperature and the concept of temperature scales.

2. First Law of Thermodynamics

Often summarized as the law of conservation of energy, it states that energy cannot be created or destroyed, only transformed.

Mathematically: $\Delta U = Q - W$ where: ΔU : Change in internal energy - Q : Heat added to the system - W : Work done by the system. Gavhane emphasizes applying this law to analyze energy balances in chemical processes, whether involving phase changes, chemical reactions, or heat transfer.

3. Second Law of Thermodynamics

This law introduces the concept of entropy, indicating the direction of spontaneous processes. It states that entropy of an isolated system tends to increase: $\Delta S_{\text{total}} \geq 0$. Understanding entropy helps engineers determine process feasibility and efficiency, especially in designing systems like heat engines and refrigeration cycles.

4. Third Law of Thermodynamics

It states that as temperature approaches absolute zero, the entropy of a perfect crystal approaches zero. Although more theoretical, this law helps in understanding absolute entropies and their calculations.

Thermodynamic Properties and State Functions

Gavhane's work emphasizes the importance of properties like temperature, pressure, volume, internal energy, enthalpy, entropy, and Gibbs free energy, which are state functions—properties dependent only on the current state of a system, not on the path taken to reach that state. Common State Functions: - Internal Energy (U) - Enthalpy (H) - Entropy (S) - Gibbs Free Energy (G) - Helmholtz Free Energy (A) Understanding these properties allows for: - Calculating energy changes during processes - Predicting phase equilibria - Assessing spontaneity and stability of systems Gavhane discusses methods to determine these properties through calorimetry, equations of state, and tabulated data, emphasizing their practical relevance.

Equations of State and Property Calculations

An essential aspect of thermodynamics involves equations of state (EOS), which relate the state variables of a system. The most common EOS in chemical engineering is the Ideal Gas Law, but real gases require more accurate models.

Ideal Gas Law

[$PV = nRT$] where: - (P): Pressure - (V): Volume - (n): Moles of gas - (R): Universal gas constant - (T): Temperature Gavhane explores limitations of ideal assumptions and introduces real gas models, such as: - Van der Waals Equation - Redlich-Kwong Equation - Peng-Robinson Equation These models help predict phase behavior, compressibility factors, and thermodynamic properties for non-ideal systems.

Phase Equilibria and Thermodynamic Models

Phase behavior is central in chemical engineering processes. Gavhane's approach involves analyzing the equilibrium between phases—liquid, vapor, solid—and understanding the criteria for phase transitions. Key Concepts: - Vapor-Liquid Equilibrium (VLE): Determined using Raoult's Law, Dalton's Law, and activity coefficients. - Liquid-Liquid Equilibrium (LLE): Involving immiscible liquids and their phase compositions. - Solid-Liquid Equilibrium: Crucial in crystallization and purification. Thermodynamic Models for Phase Equilibria: - Activity coefficient models (Margules, Wilson, NRTL, UNIQUAC) - Equations of state for vapor-liquid equilibrium - Phase diagrams and tie-lines Gavhane underscores the importance of accurate modeling for designing separation processes like distillation,

extraction, and crystallization.

Common Cycles Covered in Gavhane's Texts: - Carnot Cycle - Rankine Cycle - Otto Cycle - Brayton Cycle Analysis of Cycles: - Efficiency calculations - Work and heat transfer analysis - Effect of irreversibilities This analytical framework is crucial for improving energy efficiency and reducing environmental impact in industrial operations.

Chemical Reaction Thermodynamics

Reaction thermodynamics involves evaluating the spontaneity, equilibrium, and extent of chemical reactions. Key Parameters: - Enthalpy change (ΔH) - Entropy change (ΔS) - Gibbs free energy change (ΔG) Gibbs Free Energy and Reaction Spontaneity: $\Delta G = \Delta H - T \Delta S$ A negative ΔG indicates a spontaneous process at constant temperature and pressure. Gavhane emphasizes the use of thermodynamic data to determine equilibrium constants, reaction feasibility, and to calculate the maximum work obtainable from reactions.
