Whether used in classroom instruction or independent study, a well-designed Charles Law worksheet can significantly enhance learners' grasp of gas laws and their real-world applications.

Understanding Charles's Law

What Is Charles's Law?

Charles's Law states that, for a fixed amount of gas at constant pressure, the volume of the gas is directly proportional to its absolute temperature. In simpler terms, as the temperature of a gas increases, its volume expands, and as the temperature decreases, the volume contracts, provided the pressure remains unchanged. Mathematically, Charles's Law can be expressed as: $\frac{V_1}{T_1} = \frac{V_2}{T_2}$ where: - V_1 and V_2 are the initial and final volumes, - T_1 and T_2 are the initial and final absolute temperatures (measured in Kelvin). This relationship emphasizes the direct proportionality between temperature and volume, underpinning many phenomena in physics, chemistry, and engineering.

Historical Context

The law is named after Jacques Charles, a French physicist and mathematician, who formulated this relationship in the late 18th century. His experiments demonstrated that gases expand uniformly when heated, leading to the formulation of the law. Understanding Charles's Law is crucial for grasping how gases behave in various conditions and for applications ranging from hot air balloons to refrigeration systems.

Sample Problems and Solutions

Problem 1: Calculating Final Volume

A sample problem might state: A 2.0-liter balloon is heated from 300 K to 330 K at constant pressure. What is its new volume? Solution: Using Charles's Law: $\frac{V_1}{T_1} = \frac{V_2}{T_2}$ $V_2 = V_1 \times \frac{T_2}{T_1} = 2.0 \text{ L} \times \frac{330 \text{ K}}{300 \text{ K}} = 2.0 \text{ L} \times 1.1 = 2.2 \text{ L}$ Therefore, the balloon's volume expands to 2.2 liters.

Problem 2: Determining Temperature

A gas occupies 5.0 liters at 250 K and a pressure of 1 atm. If the volume is increased to 6.0 liters, what is the new temperature? Solution: $T_2 = T_1 \times \frac{V_2}{V_1} = 250 \text{ K} \times \frac{6.0 \text{ L}}{5.0 \text{ L}} = 250 \text{ K} \times 1.2 = 300 \text{ K}$
