Questions & Answers About computer hardware problem and solution

No	Question	Answer
1	My computer won't turn on. What could be the problem and how can I fix it?	This issue often stems from a power supply problem, loose connections, or faulty hardware. First, check that the power cable is securely connected and the outlet is working. If the power supply is suspected, test with a different power cable or replace the power supply unit. Also, ensure all internal components are properly seated. If the problem persists, consult a professional technician.
2	Why is my computer running very slowly, and what solutions are available?	Slow performance can be caused by insufficient RAM, malware, disk fragmentation, or a failing hard drive. To fix this, try closing unnecessary programs, run a malware scan, free up disk space, or upgrade hardware like adding more RAM or replacing an HDD with an SSD for faster speeds.
3	My monitor displays a blank screen even though the PC is on. What should I do?	Check all cable connections between the monitor and the PC. Ensure the monitor is powered on and set to the correct input source. If possible, test with another monitor or cable. If the issue persists, the graphics card or motherboard may be faulty, requiring professional diagnosis or replacement.
4	My computer keeps overheating. How can I prevent this problem?	Overheating can result from dust buildup, inadequate cooling, or failing fans. Regularly clean dust from fans and heatsinks, ensure proper airflow inside the case, and verify that all fans are functioning properly. Applying new thermal paste to the CPU can also improve heat dissipation. Upgrading cooling systems may be necessary for persistent issues.
5	My keyboard and mouse are unresponsive. What steps should I take to troubleshoot?	First, try disconnecting and reconnecting the devices, and test with different USB ports. Check for driver updates or reinstall device drivers. If using wireless devices, replace batteries or reconnect via Bluetooth.
