Stata is a powerful statistical software widely used in clinical research due to its versatility, robust statistical capabilities, and user-friendly interface. However, navigating its features can be daunting without proper guidance. The PPCR guide simplifies this journey, focusing on essential analysis techniques relevant to clinicians.

Getting Started with Stata for Clinical Research

Before diving into data analysis, clinicians should ensure they're familiar with basic Stata operations:

1. Loading Data: Use the ``use`` command to load datasets (``use filename.dta``).
2. Data Inspection: Use ``browse``, ``list``, and ``describe`` to explore your data.
3. Variable Management: Create or recode variables using ``generate``, ``replace``, and ``recode``.
4. Data Cleaning: Address missing values, outliers, and data inconsistencies early.

Structuring Your Clinical Data for Analysis

Clinical research data often involve multiple variables, including patient demographics, treatment groups, outcomes, and time points. Proper structuring is crucial:

1. Longitudinal Data: Multiple measurements per patient over time.
2. Cross-Sectional Data: Single measurement per subject.
3. Hierarchical Data: Patients nested within clinics or regions.

Ensure your dataset is organized accordingly, with clear variable labels and consistent coding.

Core Analytical Techniques in the PPCR Guide for Stata

1. Descriptive Statistics

Start with a comprehensive overview:

1. Summary Statistics: ``summarize`` for means, medians, standard deviations.
2. Frequency Tables: ``tabulate`` for categorical variables.
3. Graphical Summaries: Histograms (``histogram``), bar charts (``graph bar``), boxplots (``graph box``).

Example:

```
summarize age, detail
```

```
tabulate gender
```

```
graph box blood_pressure, over(treatment_group)
```

Descriptive stats set the foundation for identifying patterns, outliers, and potential issues.

1. Comparing Groups: T-Tests and Chi-Square Tests

Clinicians often compare outcomes between groups:

1. T-Test (for continuous variables):

```
ttest blood_pressure, by(treatment_group)
```

1. Chi-Square Test (for categorical variables):

```
tabulate adverse_event treatment_group, chi2
```

These tests help determine if differences between groups are statistically significant.

1. Regression Analysis

Regression models are central to understanding relationships and adjusting for confounders.

1. Linear Regression: For continuous outcomes.

```
regress blood_pressure age gender treatment_duration
```

1. Logistic Regression: For binary outcomes.

```
logit adverse_event age gender treatment_group
```

1. Interpreting Results: Focus on coefficients, odds ratios (``or``), confidence intervals, and p-values.

```
logit adverse_event age gender treatment_group, or
```

1. Survival Analysis

For time-to-event data, survival analysis is vital:

1. Kaplan-Meier Curves:

```
sts graph, by(treatment_group)
```

1. Cox Proportional Hazards Model:

```
stset time_to_event, failure(event)
```

```
stcox age gender treatment_group
```

Properly handling censoring and ensuring the proportional hazards assumption are key.

Advanced Analytical Techniques

1. Adjusting for Confounders: Multivariable Models

Multivariable regression allows you to account for multiple factors simultaneously, reducing bias.

Example:

```
regress blood_pressure age gender treatment_duration treatment_group
```

1. Handling Missing Data

Missing data are common in clinical research. Strategies include:

1. Listwise Deletion: Exclude incomplete cases (``if`` statements).
2. Multiple Imputation: Use the ``mi`` suite for more sophisticated handling.

```
mi set mlong
```

```
mi register imputed blood_pressure
```

```
mi impute regress blood_pressure = age gender treatment_group, add(5)
```

1. Subgroup and Sensitivity Analyses

Assess robustness:

```
regress blood_pressure if subgroup == 1
```

Use sensitivity analyses to evaluate the impact of assumptions or missing data.

Interpreting and Presenting Results

Effective communication of findings is as important as analysis:

1. Tables: Use ``esttab`` or ``outreg2`` for exporting regression results.

- 2. Graphs: Visualize relationships and differences.
- 3. Reporting: Clearly state methods, results, confidence intervals, and limitations.

Practical Tips for Clinicians Using Stata

- 1. Leverage the Documentation: Stata’s help files (``help command``) are invaluable.
- 2. Save Scripts: Use do-files for reproducibility.
