Deep Dive into Key Topics with MCQ Examples and Explanations

To illustrate the depth of content covered by Guyton Physiology MCQs, let's explore some critical topics with example questions and detailed answers.

1. Resting Membrane Potential

MCQ Example: What primarily establishes the resting membrane potential in nerve cells? A. Sodium-potassium pump B. Leak channels for potassium C. Voltage-gated sodium channels D. Calcium influx Correct Answer: B. Leak channels for potassium Explanation: The resting membrane potential is mainly maintained by potassium leak

channels, which allow K⁺ ions to move out of the cell, creating a negative charge inside relative to the outside. Although the sodium-potassium pump maintains ion gradients, it does not directly set the resting potential but helps sustain it. Leak channels for K⁺ are the primary determinants because they provide a pathway for K⁺ to equilibrate, establishing the negative resting potential (~ -70 mV).

2. Cardiac Output Regulation

MCQ Example: Which factor most directly influences cardiac output? A. Total peripheral resistance B. Heart rate and stroke volume C. Venous return alone D. Arterial blood pressure Correct Answer: B. Heart rate and stroke volume Explanation: Cardiac output (CO) = Heart rate (HR) × Stroke volume (SV). These two parameters directly determine the amount of blood pumped by the heart per minute. While factors like peripheral resistance and venous return influence cardiac function, the primary determinants of CO are HR and SV.

3. Regulation of Blood Pressure

MCQ Example: Which of the following is NOT a primary mechanism involved in short-term blood pressure regulation? A. Baroreceptor reflexes B. Renin-angiotensin-aldosterone system C. Sympathetic nervous system activation D. Vasoconstriction of arterioles Correct Answer: B. Renin-angiotensin-aldosterone system Explanation: The renin-angiotensin-aldosterone system (RAAS) primarily functions as a long-term regulator of blood pressure and fluid balance. Short-term regulation is mainly mediated by baroreceptor reflexes, sympathetic activation, and vasoconstriction, which rapidly adjust blood pressure in response to positional changes or stress.

4. Gas Exchange in Lungs

MCQ Example: The primary factor that determines the rate of oxygen diffusion from alveoli to blood is: A. Partial pressure difference of oxygen B. Blood flow rate C. Hemoglobin concentration D. Alveolar surface area Correct Answer: A. Partial pressure difference of oxygen Explanation: Fick's law of diffusion states that the rate of gas transfer is proportional to the partial pressure difference across the alveolar-capillary membrane, surface area, and diffusion coefficient, and inversely proportional to membrane thickness. The dominant factor for diffusion rate is the partial pressure gradient.
