Control Structures

Control structures enable flow control within macro programs: - IF-THEN-ELSE: For decision-making - WHILE, DO-WHILE: For loops - GOTO: To jump to labels Example: WHILE [1 LT 50] DO1 1 = [1 + 1] END1

Creating and Using Fanuc Macro Programs

Writing a Basic Macro Program

A typical macro program starts with defining variables, performing calculations, and controlling machine motion based on logic. Sample macro: O1001 (Simple distance calculator) 1 = 100 (Initial position) 2 = 50 (Offset) 3 = [1 + 2] G00 X[3] M30 This program moves the machine to position 150 by adding an offset to the initial position.

Inserting Macro Calls in CNC Programs

Macro programs are often called within standard G-code programs using the `M98` command. Example: M98 P1001 Where `P1001` is the program number of your macro.

Using Machine Parameters and Offsets

Fanuc macros can access machine parameters using special functions: - `100` to `599` for parameters - `1000` and above for offsets Example: 1 = [100 + 101]

Advanced Techniques in Fanuc Macro Programming

Conditional Logic and Decision-Making

Conditional statements allow the macro to respond dynamically to different circumstances. Example: IF [1 GT 100] THEN 2 = 1 ELSE 2 = 0 END

Looping and Repetitive Tasks

Loops are essential for repetitive operations like drilling or milling multiple holes. Example: 1 = 1 WHILE [1 LE 10] DO1 G81 R5 Z-10 1 = [1 + 1] END1

Custom Functions and Subroutines

Macros can be modularized using subroutines, improving code readability and reusability. Calling a subroutine: M98 P2000 Where `P2000` is the subprogram number.
