Understanding Calorimetry and Its Importance

Calorimetry is a scientific technique used to measure the amount of heat involved in chemical reactions, physical changes, or heat transfer processes. It plays a vital role in fields like chemistry, physics, biology, and environmental science by providing quantitative data on energy exchanges. The primary goal of calorimetry is to determine the heat absorbed or released during a process, which can reveal important information such as reaction enthalpy, specific heat capacities, and thermal efficiencies.

What is a Calorimeter?

A calorimeter is an insulated device used to conduct calorimetric experiments. It minimizes heat exchange with the surroundings, ensuring accurate measurements of heat transfer within the system. Common types include:

1. Constant-pressure calorimeter (coffee cup calorimeter)
2. Constant-volume calorimeter (bomb calorimeter)
3. Differential scanning calorimeter (DSC)

Each type is suited for specific types of measurements and experimental conditions.

Core Concepts Covered in Calorimetry Pogil Answers

1. Specific Heat Capacity and Heat Transfer

Understanding specific heat capacity (c) is fundamental to calorimetry. It defines how much heat (q) is needed to raise the temperature of a substance per unit mass per degree Celsius:

$$q = mc\Delta T$$

where:

1. q = heat energy (joules or calories)
2. m = mass of the substance (grams)
3. c = specific heat capacity ($\text{J/g}^\circ\text{C}$ or $\text{cal/g}^\circ\text{C}$)
4. ΔT = change in temperature ($^\circ\text{C}$)

2. Heat Exchange in Reactions

Calorimetry helps determine whether a reaction is exothermic or endothermic based on the heat exchange observed in a calorimeter. Key points include:

1. Exothermic reactions release heat to surroundings, increasing the temperature of the system's environment.
2. Endothermic reactions absorb heat, resulting in a temperature decrease.

3. Calculation of Enthalpy Changes

Using calorimetry data, you can calculate the enthalpy change (ΔH) for a reaction, which is essential in thermodynamics. For reactions conducted in solution:

$$\Delta H = -q / \text{moles of reactant}$$

where q is the heat absorbed or released, determined from temperature change and calorimeter properties.

Sample Calorimetry Pogil Answers and Step-by-Step Solutions

Example 1: Calculating the Specific Heat Capacity

Question: A 50 g sample of metal is heated to 100°C and then placed in 100 g of water at 25°C. The temperature of the water rises to 30°C. Assuming no heat loss, calculate the specific heat capacity of the metal.

Solution:

1. Write the heat transfer equations:

$$q_{\text{metal}} = q_{\text{water}}$$

2. Express heat transfer:

$$m_{\text{metal}} c_{\text{metal}} \Delta T_{\text{metal}} = m_{\text{water}} c_{\text{water}} \Delta T_{\text{water}}$$

3. Insert known values:

$$50 \text{ g } c_{\text{metal}} (100^{\circ}\text{C} - 30^{\circ}\text{C}) = 100 \text{ g } 4.18 \text{ J/g}^{\circ}\text{C} (30^{\circ}\text{C} - 25^{\circ}\text{C})$$

4. Calculate:

$$50 \text{ g } c_{\text{metal}} 70^{\circ}\text{C} = 100 \text{ g } 4.18 \text{ J/g}^{\circ}\text{C} 5^{\circ}\text{C}$$

Simplify:

$$50 \text{ g } c_{\text{metal}} 70 = 2090 \text{ J}$$

Solve for c_{metal} :

$$c_{\text{metal}} = 2090 \text{ J} / (50 \text{ g } 70)$$

$$c_{\text{metal}} = 2090 \text{ J} / 3500 \text{ g}^{\circ}\text{C} \approx 0.60 \text{ J/g}^{\circ}\text{C}$$

Answer: The specific heat capacity of the metal is approximately 0.60 J/g°C.

Example 2: Determining Enthalpy Change of a Reaction

Question: A student burns 2.0 g of ethanol in a calorimeter, and the temperature increases by 12°C. Given that the calorimeter's heat capacity is 15 J/°C, calculate the enthalpy change (ΔH) per mole of ethanol.

Solution:

1. Calculate total heat released:

$$q = \text{calorimeter heat capacity } \Delta T = 15 \text{ J/}^{\circ}\text{C } 12^{\circ}\text{C} = 180 \text{ J}$$

2. Determine moles of ethanol:

$$\text{moles} = 2.0 \text{ g} / 46.07 \text{ g/mol} \approx 0.0434 \text{ mol}$$

3. Calculate ΔH per mole:

$$\Delta H = -q / \text{moles} = -180 \text{ J} / 0.0434 \text{ mol} \approx -4144 \text{ J/mol}$$

Answer: The enthalpy change for the combustion of ethanol is approximately -4144 J/mol.

In-Depth Example: Calculating the Specific Heat Capacity of an Unknown Metal

Suppose you have an unknown metal sample heated to 100°C and placed into 50 g of water at 25°C in a calorimeter. The final temperature stabilizes at 30°C . The calorimeter's heat capacity is $10 \text{ J/}^{\circ}\text{C}$. Find the specific heat capacity of the metal. Step-by-step solution: 1. Identify knowns: - Mass of water, $(m_{\text{water}} = 50\text{g})$ - Initial water temperature, $(T_{\text{water,i}} = 25^{\circ}\text{C})$

C_f - Final temperature, $(T_f = 30^\circ\text{C})$ - Initial metal temperature, $(T_{\text{metal},i} = 100^\circ\text{C})$ - Calorimeter heat capacity, $(C_{\text{cal}} = 10\text{J}/^\circ\text{C})$ - Specific heat capacity of water, $(c_{\text{water}} = 4.18\text{J/g}^\circ\text{C})$

2. Calculate heat gained by water: $q_{\text{water}} = m_{\text{water}} \times c_{\text{water}} \times (T_f - T_{\text{water},i}) = 50 \times 4.18 \times (30 - 25) = 50 \times 4.18 \times 5 = 1045\text{J}$

3. Calculate heat gained by calorimeter: $q_{\text{cal}} = C_{\text{cal}} \times (T_f - T_{\text{water},i}) = 10 \times 5 = 50\text{J}$

4. Total heat gained by water and calorimeter: $q_{\text{total}} = q_{\text{water}} + q_{\text{cal}} = 1045 + 50 = 1095\text{J}$

5. Assuming all heat lost by metal equals heat gained: $q_{\text{metal}} = q_{\text{total}} = 1095\text{J}$

6. Calculate specific heat capacity of metal: $c_{\text{metal}} = \frac{q_{\text{metal}}}{m_{\text{metal}} \times (T_{\text{metal},i} - T_f)}$ Assuming the mass of the metal, (m_{metal}) , is known or measured. If, for example, $(m_{\text{metal}} = 20\text{g})$: $c_{\text{metal}} = \frac{1095}{20 \times (100 - 30)} = \frac{1095}{20 \times 70} = \frac{1095}{1400} \approx 0.78\text{J/g}^\circ\text{C}$ This value can then be compared to known specific heat capacities to identify the metal.
