Sample Questions and Explanations from 2016

To give a concrete sense of the exam, here are examples of typical MC questions from 2016 with detailed explanations. Question 1: “An increase in consumer confidence most likely causes which of the following in the AD-AS model?” Options: a) Leftward shift of AD b) Rightward shift of AD c) Leftward shift of AS d) Rightward shift of AS Explanation: An increase in consumer confidence generally boosts consumption, leading to a rightward shift of aggregate demand, so Option b is correct. Question 2: “If the economy is at full employment and experiences an increase in aggregate demand, what is the

most likely short-run result?" Options: a) Higher output with increased inflation b) Lower unemployment with lower inflation c) No change in output or inflation d) Higher unemployment and lower inflation Explanation: At full employment, a rise in AD leads primarily to higher prices (inflation) rather than increased output, so Option a is correct. Question 3: "A decrease in the reserve requirement ratio will most likely result in which of the following?" Options: a) Decrease in the money supply b) Increase in the money supply c) No change in the money supply d) Decrease in the interest rate Explanation: Lower reserve requirements allow banks to lend more, increasing the money supply, so Option b is correct.

Common Challenges and Misconceptions in 2016 MC Questions

While the 2016 questions aligned well with standard curriculum, students often faced pitfalls such as: - Confusing shifts of AD versus AS curves. - Misinterpreting the effects of policies without considering the short-term versus long-term impacts. - Overlooking the assumptions behind models, e.g., whether the economy is at full employment. - Failing to connect data or graphical information to real-world concepts. Addressing these challenges requires comprehensive review and practice.
