Multiply the external term by each term inside the parentheses. Example: $2(x + 3) = 2x + 2 \cdot 3 = 2x + 6$

Step 3: Simplify the Result

Combine like terms if possible. Example: $3(2x + 4) + 5x = 3 \cdot 2x + 3 \cdot 4 + 5x = 6x + 12 + 5x = (6x + 5x) + 12 = 11x + 12$

Step 4: Verify Your Work

Check if the expression is fully simplified and if all distribution steps are correctly performed.

Practical Tips for Using the Worksheet Effectively

- Start with easy problems to build confidence before moving to complex ones. - Read each problem carefully to identify the parts requiring distribution. - Show all work to track the steps, which aids in learning and error correction. - Use the answer key to self-assess and understand mistakes. - Practice regularly to reinforce skills and improve speed. - Ask for help if certain problems are consistently challenging.

Common Mistakes to Avoid When Simplifying Expressions with Distributive Property

- Forgetting to distribute to all terms inside the parentheses - Distributing incorrectly (e.g., multiplying only one term) - Mixing up signs when distributing negative coefficients - Failing to combine like terms after distribution - Overlooking the order of operations
