Importing Data from Multiple Sources

Power Query allows you to import data from multiple sources simultaneously, which is vital for consolidating disparate datasets. Best practices: - Use consistent naming conventions for queries. - Keep raw data separate from transformed data for clarity. - Schedule regular refreshes to keep data up-to-date.

Combining Data in Power Query

Often, datasets need to be combined to create a comprehensive dataset for analysis. Power Query provides powerful methods for merging and appending data.

Merging Queries (Joining Tables)

Merging combines data based on a common key, similar to SQL joins. Steps for merging data: 1. In Power Query Editor, select one query. 2. Click 'Merge Queries' from the ribbon. 3. Choose the second query to merge. 4. Select matching columns in both tables. 5. Choose the join kind: - Left Outer: All from first, matching from second. - Right Outer: All from second, matching from first. - Inner: Only matching rows. - Full Outer: All rows from both. 6. Expand the merged column to include desired fields. Use cases: - Combining customer information with sales data. - Merging product details with transaction records.

Appending Queries (Stacking Data)

Appending stacks data from similar tables vertically. Steps for appending data: 1. In Power Query Editor, go to 'Home' > 'Append Queries'. 2. Select whether to append two tables or multiple tables. 3. Arrange the tables in the desired order. 4. Confirm to generate a combined dataset. Use cases: - Consolidating monthly sales reports. - Combining survey responses collected over multiple periods.
